

AISCA – GPU Access

Onboarding & Operations SOP

AI Skills and Compute Africa Foundation

Introduction

This guide walks through the core Rafay Console procedures used to provision a virtual machine, adding a project, and viewing a project.

1. Creating a Virtual Machine (Developer Hub)

Customer VMs are provisioned through the console portal. This is the flow to follow when provisioning a VM.

1. Open the Services menu (grid icon, top left) and select Developer Hub.

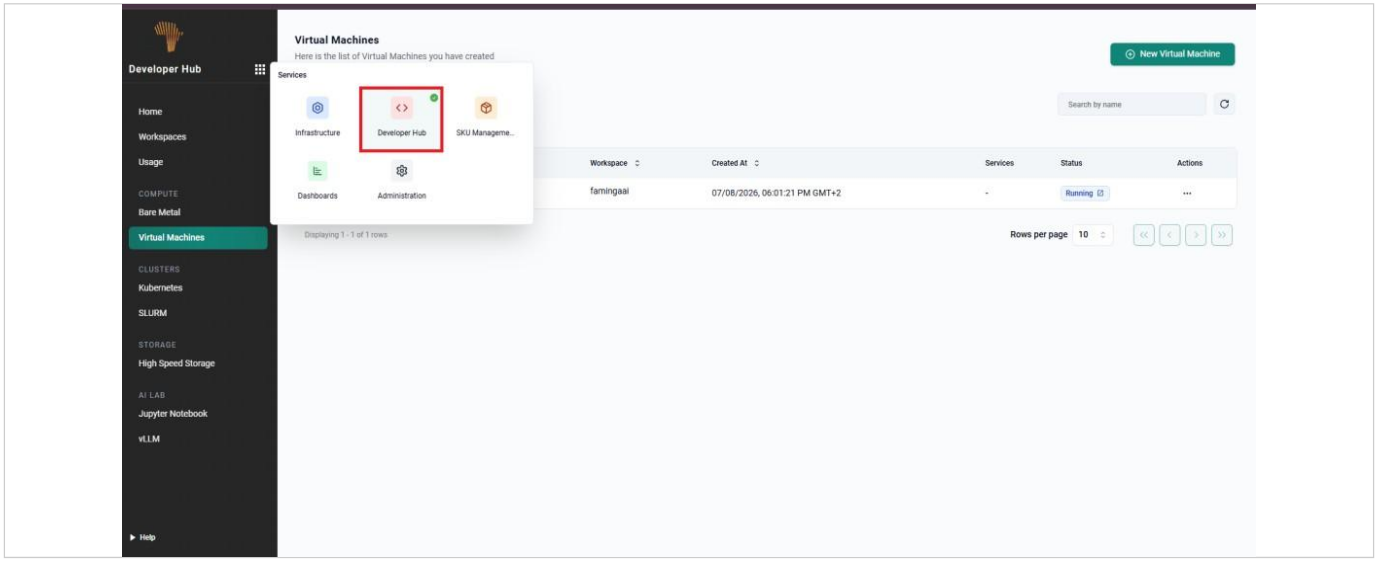

Figure 5 – Switching to Developer Hub from the Services menu.

2. In Developer Hub, under Compute in the left sidebar, select Virtual Machines.

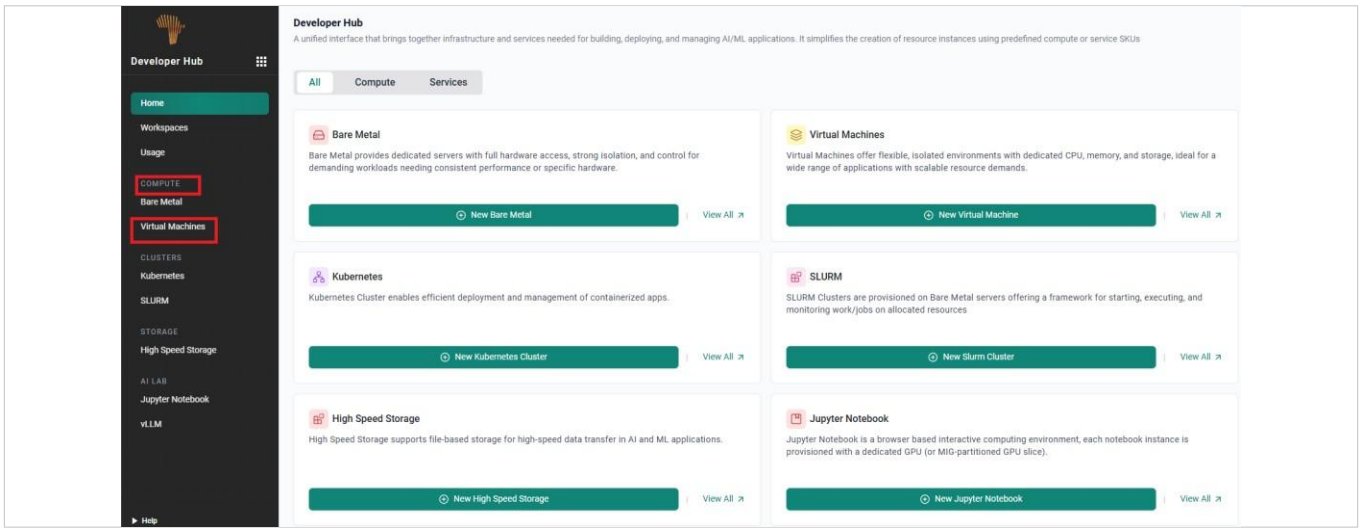

Figure 6 – Developer Hub Home – Compute → Virtual Machines.

3. On the Virtual Machines page, click + New Virtual Machine.

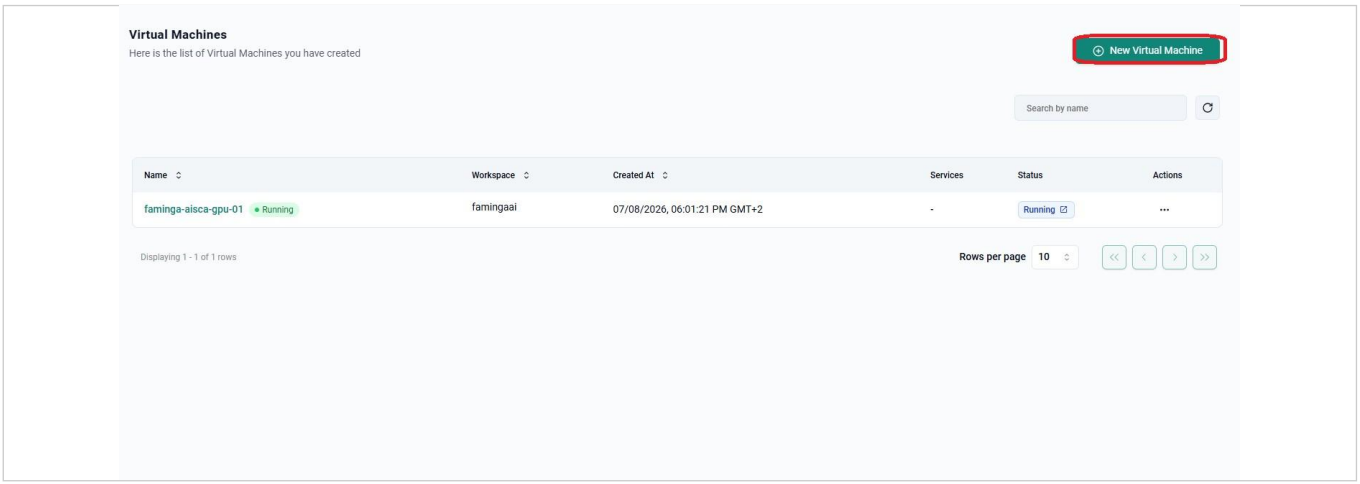

Figure 7 – Virtual Machines page – New Virtual Machine.

4. In the Virtual Machines Catalog, click Read Me to review the resource's specs (GPU, vCPU, RAM, storage), then click Select to choose that SKU.

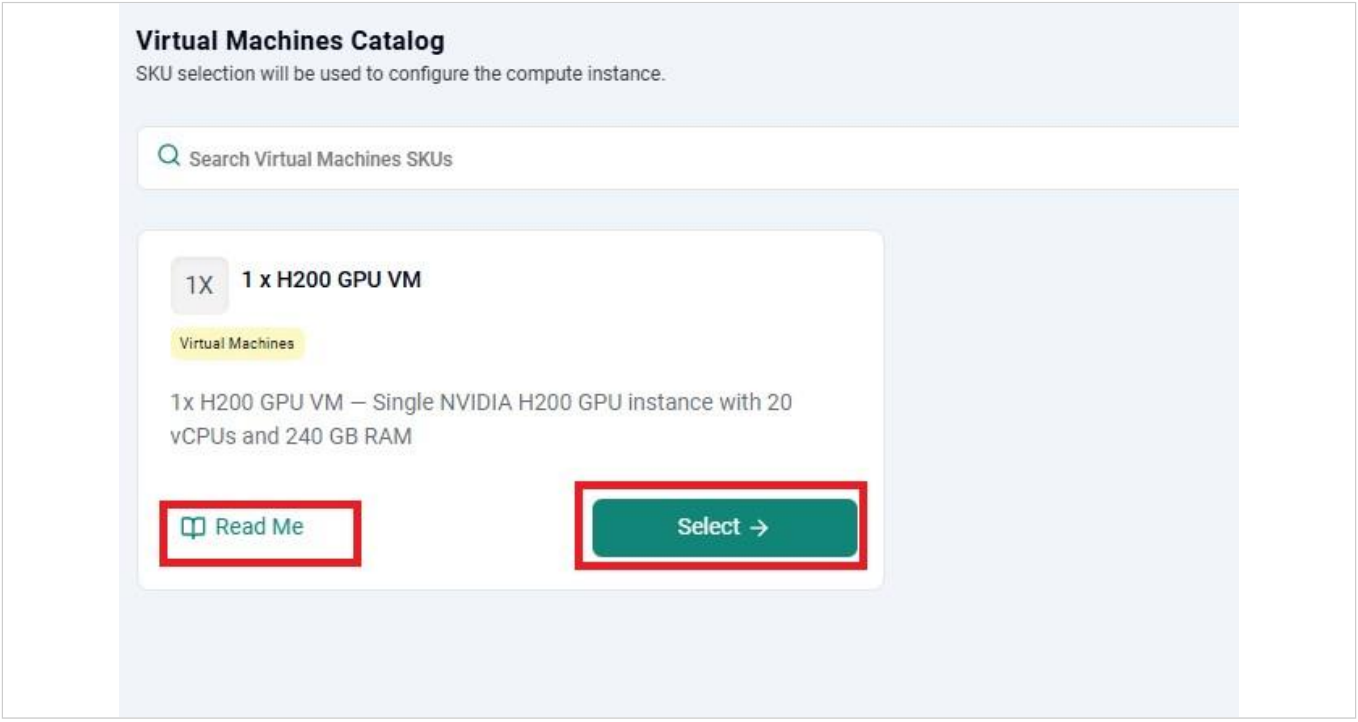

Figure 8 – Virtual Machines Catalog – Read Me and Select.

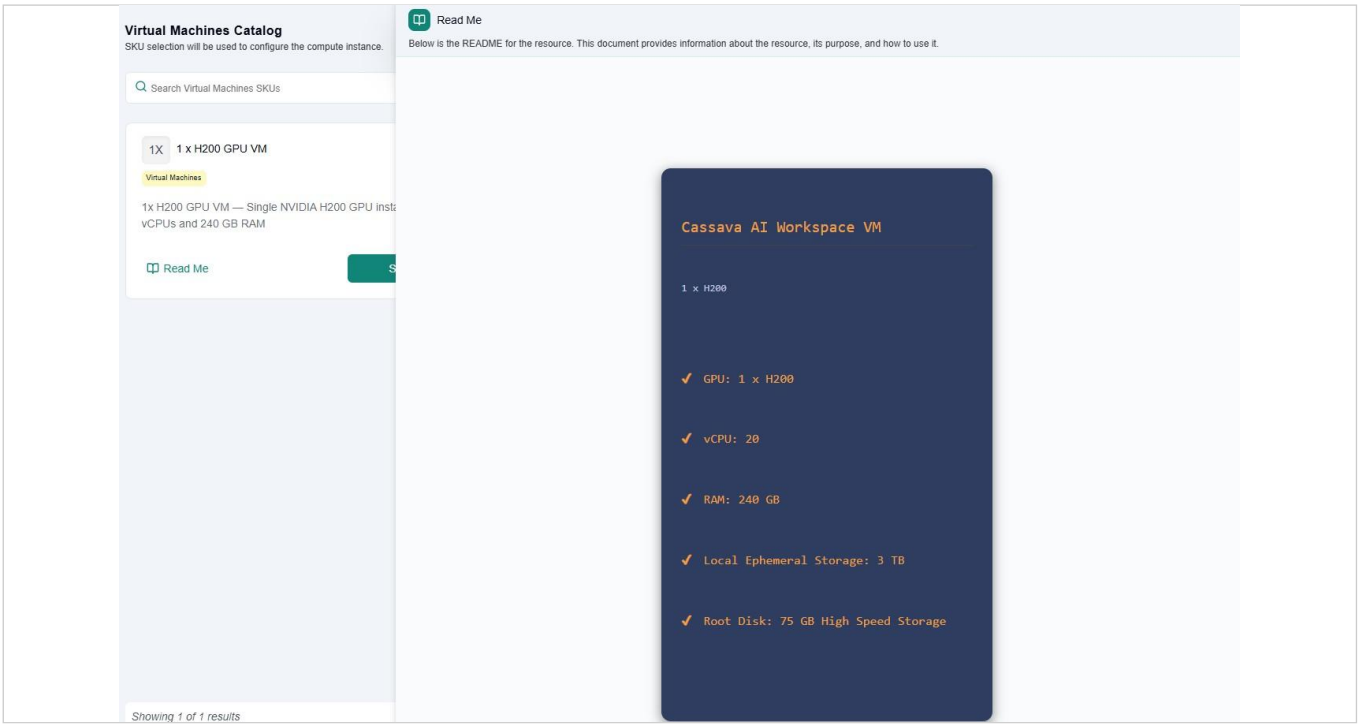

Figure 9 – Read Me panel with the resource specification.

5. Enter the required info: a name for the VM, the Workspace it belongs to, (attach High Speed Storage).

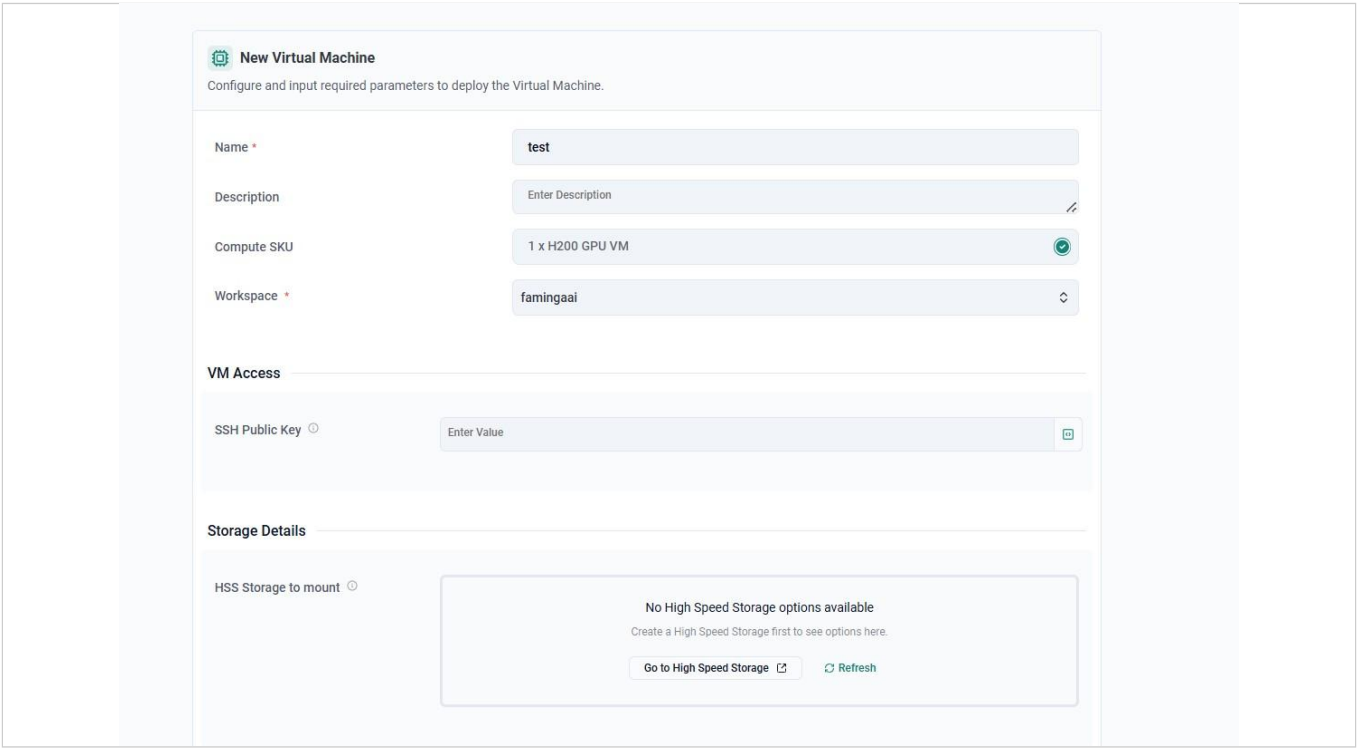

Figure 10 – New Virtual Machine – Name, Workspace, VM Access, Storage.

6. Under Network Details, set *Assign Public IP* to **true**, and add a Security Group rule to allow ***SSH access*** from the customer's IP address(es). This is an important step since access is primarily through SSH.

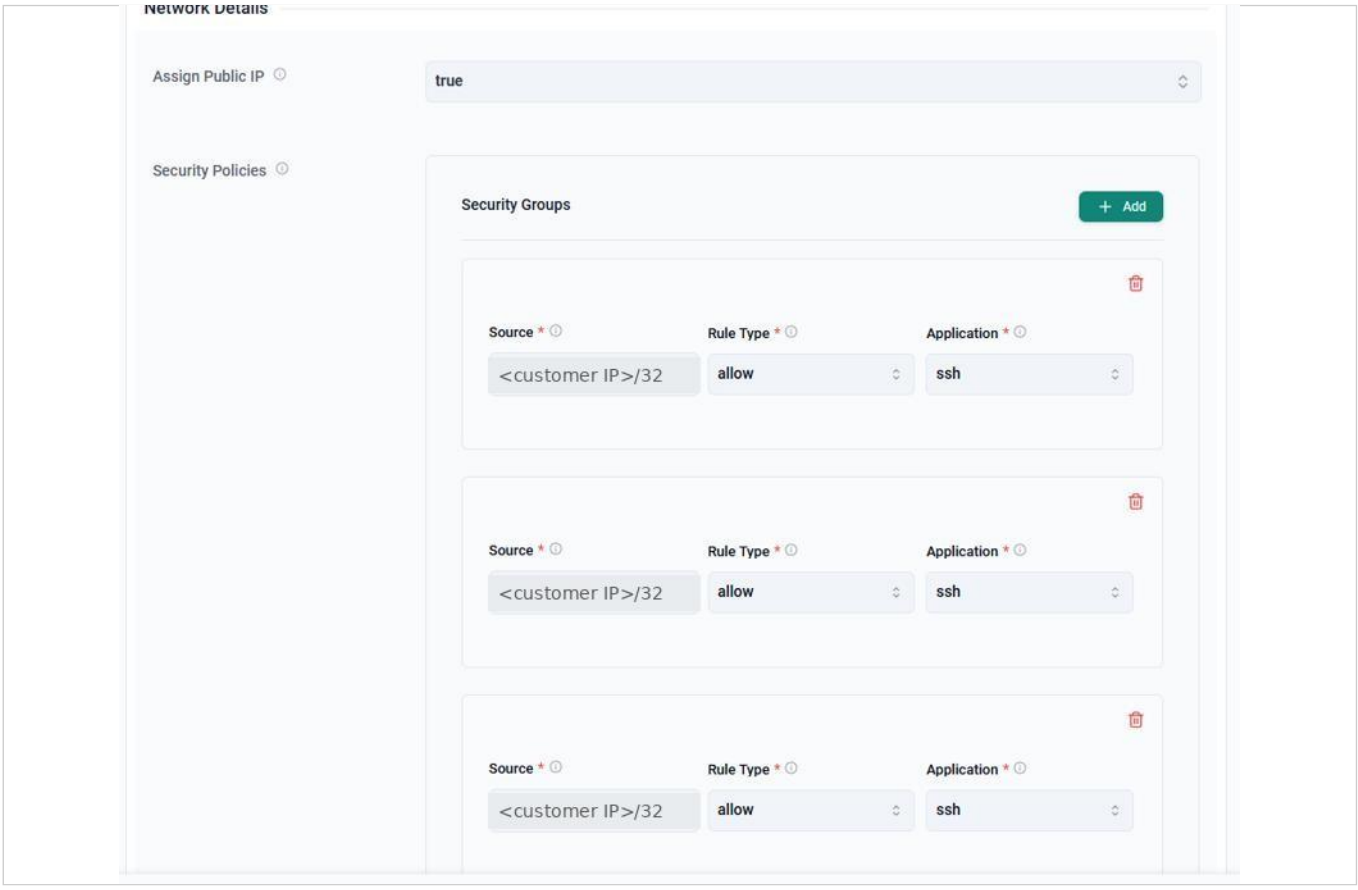

Figure 11 – Network Details – Public IP and Security Groups (allow SSH).

7. Confirm VM Details (OS, GPU/CPU count, memory, boot disk, ephemeral storage) and Billing Details (Contract Term), then deploy.

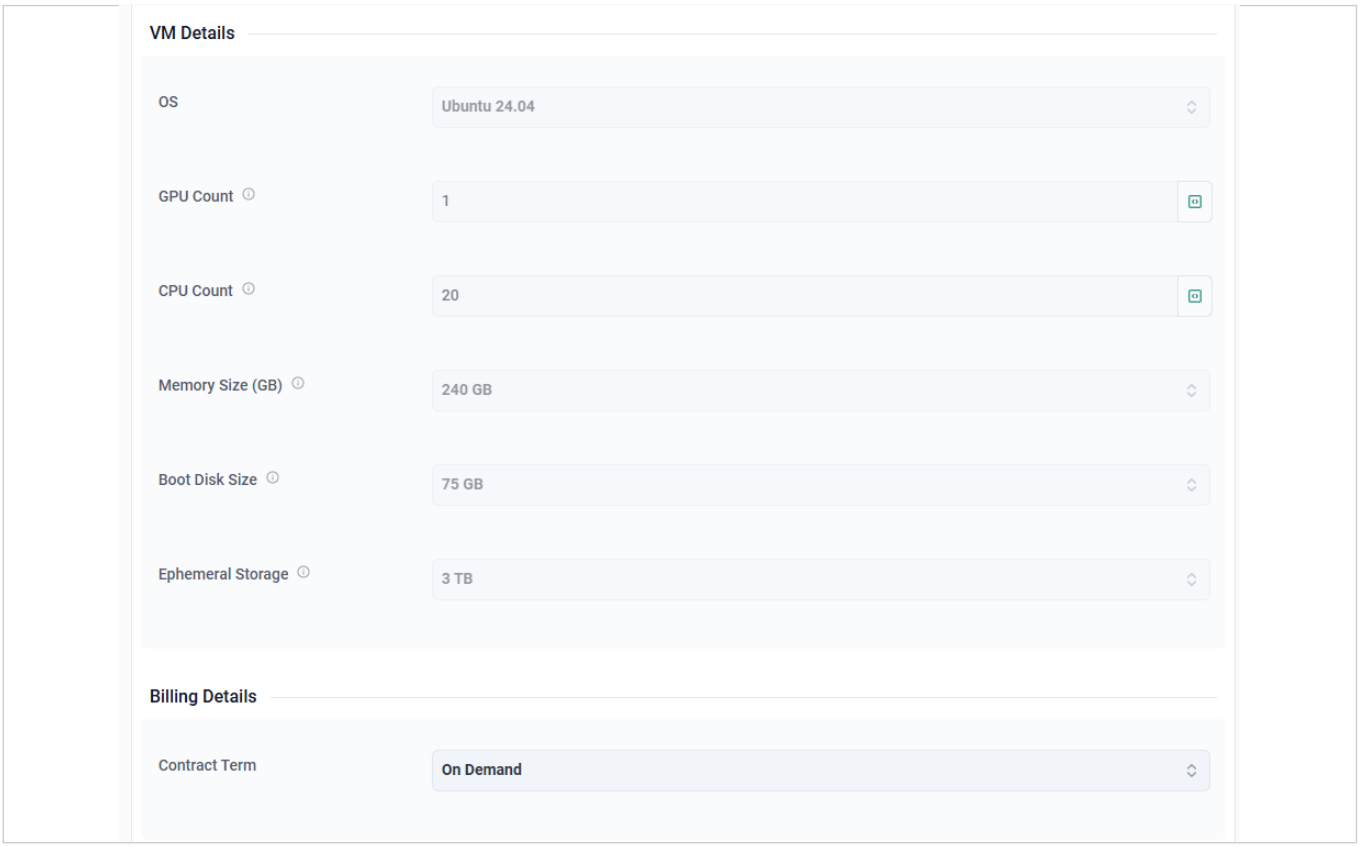

Figure 12 – VM Details and Billing Details.

8. Once deployed, the Output section shows the Host Name, Username, Password, Public IP, Private IP, OS, and Ephemeral Storage. Share the Public IP, Username, and Password with your team after provisioning completes.

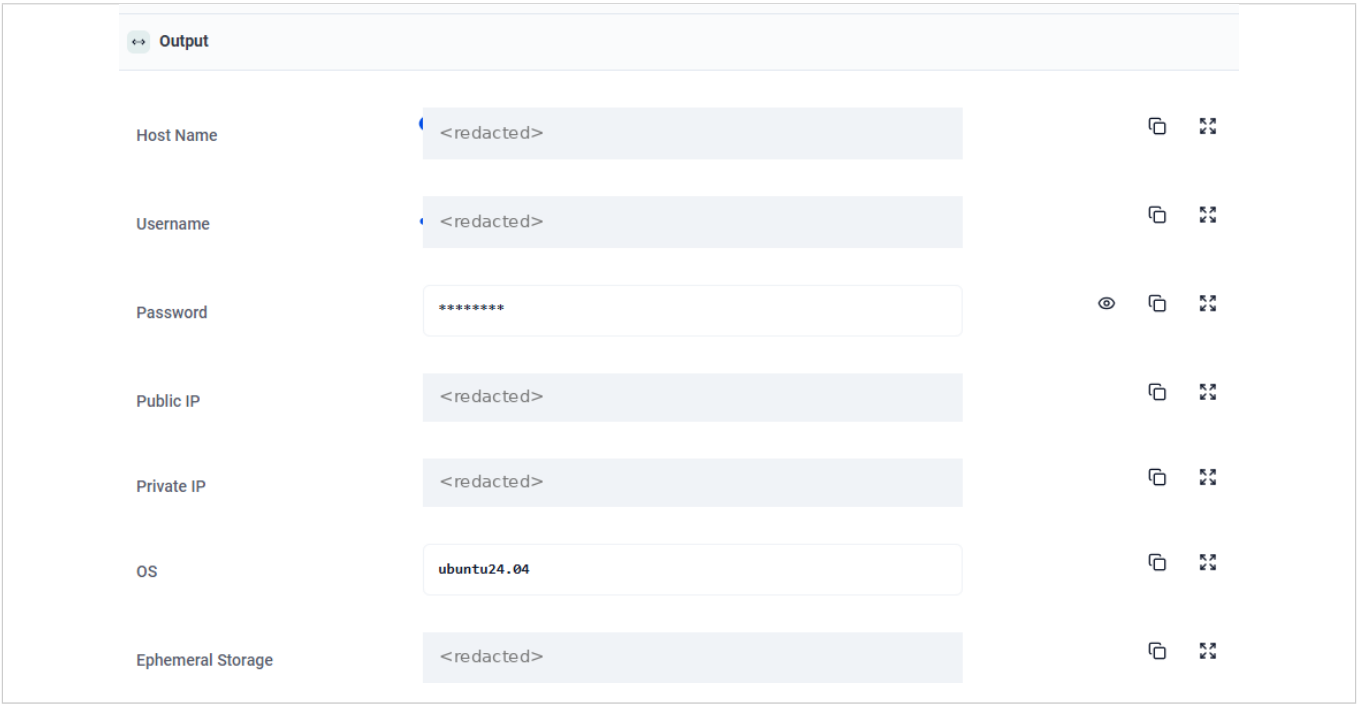

Figure 13 – Output – connection details to share with the customer.
